

a The cut-off lies below every non-zero value
 $(\log_1 p \text{ CP10K} > 0.5) \equiv (\text{count} > 0): 0 \text{ mismatches in } 10/10$

b Every matrix is 41-385x below the bound
 deepest *cuTAR*-bearing spot: 40-380 reads

c The mask counts depth, not expression

d Continuous statistics survive the same depths
